Wear It, Drive It -- Themes at CES 2014

By NBC Southern California
Jan 05, 2014 03:24 PM

Tech lovers from around the world are converging on Las Vegas tonight. The annual Consumer Electronics Show is underway and Mekahlo Medina is there. He reports for the NBC4 News at 11 p.m. on Sunday, Jan. 5, 2014.

Wear it, drive it or fly it appear to be the themes evolving from the Consumer Electronics Show's sneak peek event "Unveil" Sunday in Las Vegas.

It's the first event in the country's oldest and largest electronics show that officially kicks off on Tuesday.

NBC4 scoured the floor at the event to find emerging technology that dazzled CES officials and soon the public. Among the big favorites is a simple concept, earphones embedded into a headband for running.

"RunPhones" walked away with an innovation award at the show and was a big hit on the floor. "It's a simple concept, but one that a lot of runners needed," said Casey MacIoge, RunPhone marketing manager. "Earbuds always fall out of your ear and it can ruin the running experience. This solves it."

Drones are also back this year, but they have evolved from toys.

DJI Innovations, with offices in Los Angeles, showed off an eight propeller drone that can hold a Canon 5D camera and be used by cinematographers.

The idea could be revolutionary for Hollywood and cost effective.

"It's still in the early stages, but the prototype images are amazing," said Paul Pan, DJI Innovations product manager.

"We still need to gain federal approval to fly these devices, but we are confident we are well on our way."

The Federal Communication Commission is set to address drone use for business by 2015. Amazon has recently unveiled its plan to use the devices for delivery purposes.

Cars will also be highlighted at CES this year with nine of the world's top manufacturers showcasing at the show.

Ford is expected to unveil a solar powered car with solar panels built into the roof of the cars.

But by far, the biggest trend appears to be wearable technology.

From wristwatches that sync to your mobile device to fitness monitors that collect data on your body, wearable technology is set to dominate the show.

"We are advancing our wearable technology from not only a device but also advice," said Paul Landau, CEO of FitBug. "We want to take the data FitBug collects and help design a program that you choose that can help you lose weight or build muscle."

Heapslyon unveiled the world's first "smart socks."

The \$100 socks can track how a user's foot hits the ground, the rhythm of each step and length of each stride.

The socks' sensors learn how the user runs and claim they can alert people to the possibility of injury. Heapslyon is among an emerging trend of startups that raised money through online investors like crowdfunding sites Kickstarter or Indiegogo.

WholeFoods Admin's blog

3-D printing, wearable technologies and robots are all making headlines for their Jetsons-quality lifestyle implications.

These are not prototypes. High tech isn't as conceptual as it once was. I walked the floor of the **Consumer Electronics Show (CES)** from January 7 to 10 in Las Vegas and I can tell you first hand that these technologies are here and they are real, and to my surprise, they are not intimidating at all. They are thrilling, especially to a tech-novice like myself.

Ahead-of-the-curve gadgets are reaching more than the geeks who seek them out. New technologies are becoming more understandable, affordable and available to the mainstream.

I could find a personal use for just about everything I saw on the show floor. And most of these gadgets look as good as they work.

Here are some of the trends I predict you will get used to seeing around in the next year.

Style enhances function. If you are going to use something every day, you want to look as good as it works. Tech equipment is getting prettier. Check out **Uniden's** Cellular Signal Booster and **Teenage Engineering's** speakers for examples of uber stylish tech. There was also a surplus of stylish vintage-inspired gadgets with lots of throwback-looking jukeboxes, microphones and headphones.

Changing the scale. Measuring is going really high tech. **Tanita** was one of the first scales to show at the CES Digital Health Conference. As competitors starting coming in this company introduced a wide array of scales to measure just about everything and you can do it your bathroom or the doctor's office. There are all kinds of tracking devices but my new favorite is the SugarSenz by **Glucovation**, which monitors your blood sugar so you learn how your individual body metabolizes sugar, so you can eat (and diet) more efficiently. **Lumo** monitors how you are standing and **Hollywog's** Neubac device uses electromagnetic waves to numb back pain on the go.

Two in one. Companies like **AwoX** are bringing dual uses to everyday products. The brand's new StrimLight technology streams music from your phone or computer to your room through a lightbulb. **ivee** alarm clocks also function as wireless voice-activated personal assistants answering you with the time, weather, stock prices and more.

The 3D craze. Everyone is talking about 3D printing and its possibilities. **RoBo3D** is bringing its well-known quality printers to consumers. **WhiteClouds** allows you to doodle your ideas for a skilled technician to create for you to print...sort of a like a cake recipe that just requires you to break an egg.

A new way to get around. Not since the Segway have we seen this many new types of transportation. More than one auto brand introduced an enclosed motorcycle. My favorite is the Kobo from **Lit Motors**. Its gyroscopes keep you from tipping over.

Personal touch. From vibrating toothbrushes from **FOREO** to **RunPhones** wireless headphones there were hundreds of innovations that will change the way we do everyday tasks.

Sharper hearing. Hearing takes center stage and "readers for your ears," a.k.a. gadgets to help you hear, are cropping up. Beans by **Etymotic** come in platinum, bronze and brushed gold. Music was big in a different way than just hearing it through speakers, spanning out to instruments and musician-inspired tech with electronics bringing new relevance to artists from Vanilla Ice to 50 Cent.

Let the robot do it. There is a robot for everything. **Ecovacs Robotics** had its FAMIBOT out in full force. This robot is a companion, entertainer, personal home network connector and security guard all in one.

I'm looking forward to seeing these gadgets at retail and becoming a part of our daily scenery. **WF**

What's cool at CES 2014: Robots, headbands & bulbs

Jefferson Graham takes a look at some of the attention-grabbing products at CES 2014.

LAS VEGAS — We roamed the previews at CES 2014 Sunday night to get a glimpse at some cool new tech products.

Here are some of the new gizmos that got our interest:

- A robot vacuum cleaner is wonderful, but how about one that doubles as a wet-and-dry mop? We saw the folks at Moneual test it out. They drew on a table and spilled wine as well, and the unit picked both of them up. The Moneual Rydis H68-Pro device is priced at \$499 and is expected to be in stores by June.

- Headphones that you wear as a headband. The "RunPhones" start at \$39.99 with a wire, or sell for over \$100 with a wireless version.

- The battery-powered LED light bulb. There are lots of new LED light bulbs here at CES that run via apps, and that's cool. But how about a battery-powered bulb that promises to still shine — for as long as four hours — in the event of a power outage?

Now that's really cool.

The Smart Charge LED bulb, expected in stores this summer, will sell for \$29.99 each. "You will never see a power outage," says Shailendra Suman, here at CES to promote his product.

Tech Travel Trends You'll See in 2014: Wearable Everything

By [Nikki Ekstein](#)

Las Vegas is buzzing this week for Consumer Electronics Show (CES) 2014, and T+L is here to provide you with the latest from the conference floor. Read on for a look at the tech trends that will change the way you travel this year.

Wearble Everything: [Google Glass](#) may have dominated the blogosphere in 2013, but this year, we'll be seeing a wider array of smart wearables that will take you from the beach to the slopes. A few of our favorites:

Smart goggles

[Liquid Image](#) is one-upping mounted action cameras, like the popular Go Pro, by embedding an HD camera straight into your ski goggles. Thanks to built-in connectivity, you can also live stream your footage.

RunPhones

They're not the only earbuds we've seen that are completely cordless (a trend all its own), but they are the only ones on our radar that will coach you through your runs, meaning you can now take your personal trainer on the go.

FitBug

You've heard of FitBit, JamBone, and the dozens of other fitness trackers (CES is downright flooded with them this year!). This super-affordable version comes bundled with 12-week training courses to help you get in shape for your next trip. Exercises are tailored for each goal, with programs that are likely to suit your next vacation (think Golf Gorgeous or Bikini Bod).

June by Netatmo

Worried about over-exposure at the beach? This smart bracelet synchs with an app to tell you what the local UV index is, what type of sunscreen you should be wearing, and when to reapply. The design is downright stunning—it was crafted not by engineers but by a former LVMH jeweler—and the app even tells you when you ought to pack sunglasses and a hat. (Just watch your tan lines.)
